

For the antibody that you normally use at 1:1000 dilution:

1. I add 1 ul of the serum into 40 ul of 2 mg/ml immunising peptide solution (in dH₂O) in an eppendorf tube
2. Incubate for 30 min at 37C (Heating block) and then spin it for 10 min at 14000 g. Adjust the volume of the supernatant to 1 ml with the antibody diluant buffer (0.1% skim milk in TBST).
